

# OBGYN & PEDIATRICS DVD

## Cat.# MS-23I - EARLY ANTENATAL CARE AND AMNIOCENTESIS DVD

First, Sir Naren Patel explores the issues of early antenatal care by reference to a 37-year old woman requesting testing for Down's syndrome. The pros and cons of different tests are discussed, and Drs McCulloch and Owen carry out an amniocentesis under Ultrasound control. The issues are discussed, and finally Dr Sandy Christie carries out a late anomaly scan.

## Cat.# MS-24I - CARE IN LATE PREGNANCY DVD

On this film four women in late pregnancy are presented. The first has a normal pregnancy, and systematic abdominal examination is demonstrated, and includes measurement of fundal height, and the use of a portable Doppler ultrasound machine to detect the baby's heartbeat. The second case is of a twin pregnancy; the third has polyhydramnios; and the fourth is an insulin-dependent diabetic lady. The film finishes with a demonstration of the use of the cardiocotograph to monitor the foetus, and its interpretation.

### ASSESSMENT AND TREATMENT OF COMMON GYNAECOLOGICAL DISORDERS DVD

On this film we see the detailed assessment of a woman with two problems; an abnormal cervical smear and a large pelvic mass, which is probably a benign cyst. The major concerns of the patient, regarding the question of oophorectomy, and hormone replacement therapy are sympathetically addressed. Techniques demonstrated include colposcopy and pelvic ultrasound (Dr Sandy Christie).

## Cat.# MS-7I - EXAMINATION OF THE BREAST DVD

The systematic examination of the breast is demonstrated on a model, who is then instructed in the technique of self-examination. Galactorrhoea is demonstrated, and nipple discharge generally discussed. The systematic examination is then demonstrated again on a lady with a malignant breast lump, skin tethering, and axillary lymphadenopathy. This new edition concludes with demonstrations of the techniques for mammography and breast ultrasound by an experienced radiographer, and a discussion of their use in the diagnosis of breast cancer.

## Cat.# MS-20I - DEVELOPMENTAL ASSESSMENT DVD

Peter Sullivan takes us through the stages of normal development, under the headings of Gross Motor; Fine Motor and Vision; Hearing and Speech; and Social Interaction. This is demonstrated by his carrying out assessment in a baby of 3 months, an infant of 10 months, the same little girl at 18 months, and in a 2.5- year old (including the free field distraction hearing test). This has proved to be very useful introduction to this aspect of paediatrics.

**Cat.# MS-211 - EXAMINATION OF THE CHILD DVD**

The technique of physical examination changes with age, and on this film examples are given of the technique of routine physical examination of the newborn; the infant of 10 months; the 2.5 year old (examination of the ear, nose and throat); and the six-year old, where the examination technique approaches that used in the adult. These should provide valuable role models of good technique for students and trainees in paediatrics to follow.

**Cat.# MS-221 - SICK CHILDREN DVD**

There are five sick children illustrated in this film, and together they provide a useful introduction to the sick child, and how illness in children presents - with the similarities and differences from disease in adults. Patient 1 is a young baby with classical whooping cough (pertussis); patient 2 is a baby with a VSD and bronchiolitis; patient 3 is a nine-year old child with an abdominal swelling, due to nephroblastoma; and patients 4 and 5 have severe cerebral palsy, of which Martin Bax is a world authority on assessment and management.

**Cat.# MS-491 - AIDS AND TUBERCULOSIS IN CHILDREN DVD**

Tuberculosis is one of the opportunistic infections to which AIDS patients are especially vulnerable, because they fail to mount an adequate immune response. Their concomitant spread has been associated with the widespread development of multi-drug resistance of tuberculosis. On this film we examine their prevention and management both separately and together, concentrating on the plight of children in the developing world, and also hear of the programme in Thailand for the prevention of mother to child transmission of AIDS.
